MaYo HOLDINGS AND CONSTRUCTION (MHC), INC.	MITSD		
Schedule (Date):	Number of Working Hours:		
APRIL 27 - APRIL 30, 2026	32 HRS		

Weekly Accomplishments

The student trainee should give a summary of the tasks performed during the week and how it was accomplished.

Day 54 - On the first day, my primary focus was finalizing the comprehensive website turnover documentation. I structured the manual to be highly readable and accessible for non-technical users, detailing all implemented features and providing clear, step-by-step instructions for executing common website maintenance tasks. Additionally, I optimized the site's backend performance by properly configuring the LiteSpeed Cache plugin, which significantly improved page load speeds and streamlined the database environment.

Day 55 - On the second day, I dedicated the morning to refining the website's user interface, specifically enhancing the Projects section by adding an opacity-lowering hover effect to the project cards for a more polished and interactive visual experience. I also coordinated with the IT department to verify the status of the SSL certificate required for secure hosting. Furthermore, I implemented a direct Call-to-Action (CTA) button designed to instantly open the user's mail client and route applications directly to the HR department's email. During the final hours of my shift, Sir Jerico and I initiated the live deployment phase, troubleshooting server configurations and researching why the WordPress site was failing to resolve publicly.

Day 56 - On the third day, I successfully resolved yesterday's deployment issues by configuring a web portal redirect that correctly points the server root to the WordPress directory, officially bringing the website live. I formally presented this technical solution and the successful publishing of the site to Sir Bernabe and Sir Jerico. Following the launch, I executed a critical database search-and-replace operation to update all internal URLs from the local development IP (192.168.0.104/wordpress) to the live production domain (landing.mayogroup.biz). Finally, I conducted a thorough post-migration audit to identify and resolve any broken links or structural issues resulting from the environment transfer.

Day 57 - Today I spent a couple of hours on advanced performance tuning after encountering slowness issues on the live staging site. With Sir Jericho as my mentor, I diagnosed the issue and found a newly deployed WordPress plugin that caused a conflict and significantly delayed the site's first load. It was immediately deactivated to achieve immediate results. To avoid additional backend instability and future memory issues, I updated the server configuration to set the WordPress memory limit (WP_MEMORY_LIMIT) from the recommended 40MB to 512MB. This vital tweak helps ensure there's enough processing power for memory-intensive plugins such as Elementor. Finally, I successfully configured the WP Super Cache plugin which improved the delivery of assets and improved the site to a solid 92 performance rating.
